

Have you wondered why the clothes in your washing machine are not getting cleaned properly? Or Why your shower panel is not giving the desired quantity of water? This is because the water in your household is hard water.

The Calcium and Magnesium dissolved in water are the two most common minerals that make water "hard". The hardness of water is usually measured in parts per million (ppm).

Affected by various parameters (temperature, flow & pressure) dissolved cations like Calcium and Magnesium precipitate from water depositing in the internals of pipes and fittings. It is normally referred as scaling.

Scaling creates white marks, leads to clogging of water pipes, affects the cleaning ability of washing machines, reduced heating efficiency of a water heater and faster wear and tear of appliances.

To overcome these household issues Racold has introduced Anti Scaling Solutions- which are better, smaller and easier than conventional softeners.

These solutions can be used with various appliances like water heaters, washing machines, dish washers and shower panels to name a few. Once installed they last up to 6 months depending on the hardness of the water passing through. They are economical, easy to install and incur no water wastage during the installation process.
